

To Whom It May Concern,

I am writing to highly recommend the use of ACT for mitigating the harmful effects of illicit discharges. Having witnessed its effectiveness firsthand, I can confidently attest to its remarkable mitigation capabilities.

ACT stands out for its unparalleled ability to swiftly mitigate the impact of hydrocarbons and biological hazards on both land and water environments. It not only effectively breaks down and absorbs oils, chemicals, and other hazardous substances, but also facilitates their safe and eco-friendly disposal. Additionally, its versatility allows for application across a wide range of surfaces and scenarios, making it an invaluable tool for emergency response teams, environmental cleanup efforts, and industrial applications alike.

The City of Greeley has assessed its effectiveness during an illicit discharge response for an oil spill within our Weber West detention pond. We found that it has the ability to mitigate oil discharges on water surfaces and will also penetrate several inches into the soil. We have equipped all City of Greeley facilities and maintenance vehicles with ACT due to its versatility, effectiveness, and proven track record.

In summary, ACT has proven time and again to be an indispensable asset. Its reliability, efficacy, and environmentally conscious approach make it a standout choice for any organization seeking to thoroughly mitigate hydrocarbon discharges and biological hazards.

Sincerely,
